

Spreading 36 Points in the Plane

Limin Ge*

October 8, 2026

Abstract

We place 36 points in the plane so that the squared ratio of the largest to the smallest distance between them is at most 32.83385+. Erich Friedman’s table of best known configurations lists n up to 31. Deleting a point from our 37-point configuration gives 33.16344; this one is smaller. The ratio is computed exactly from the published coordinates. We do not claim it is optimal.

1 Result

Theorem. *There are 36 points in the plane with*

$$\left(\frac{\max d}{\min d}\right)^2 = 32.83385\dots$$

The exact value, a rational number, is given in Appendix A.

2 Context

Erich Friedman’s page *Minimizing the Ratio of Maximum to Minimum Distance* lists the best known configurations for $n \leq 31$. The value for $n = 36$ is not on the page. Deleting a point from our 37-point configuration gives 33.16344; this one is smaller.

3 Verification

The coordinates are decimals with 12 digits after the point, so they are exact rationals; all squared distances, and their largest-to-smallest ratio, are computed with integers. Run

```
python friedman-maxmin2d/verify.py friedman-maxmin2d/coords/n36.txt
```

in <https://github.com/Ge-limin/math719>.

4 How it was found

Random starts of a constrained local optimizer (SLSQP), then basin hopping seeded from the neighbouring sizes (`friedman-maxmin2d/`).

A Exact value

```
numerator:
32833850400142367679663341
denominator:
999999999998385733200960
```

*Found and checked by Claude, a model released by Anthropic, running on the author’s laptop. The author sent the prompts.

B Coordinates

36 points, x and y per line. File: `friedman-maxmin2d/coords/n36.txt`.
